Ftdi driver install windows 10

1 / 26 Construction Pro TipsConstruct Pro TipsBack in a day, most window installations went something like this: Set, level, square, nail, spray foam, and then to the next. There are a few more steps these days, and not everyone has anything to do with preventing water from getting inside. Many modern steps of installing windows are designed to allow water to come out, if it ever finds a way. To make sure we succeeded, we asked our local Tyvek representative Lori Gunderson and Marvin Window installation guru Eric Klein to walk us through the process. In addition to the appropriate procedures, Eric shared a bunch of tips, tips and tricks to install. In this story, we demonstrate how to install Marvin's double-hung window. Many of these steps are shared by window manufacturers, but not all. Always follow a specific instruction for other brands you install. 2/26 Construction Pro TipsRoll home cover or WRB (Weatherproof barrier) across the entire window opening. Then cut the center of the WRB and cut it in the plane at the top and bottom of the opening. 3/26 Construction Pro TipsCut at an angle of about 6-inches, up and away from all four corners. Note at the beginning: Window manufacturers do not require lower corner cuts. 4/26 Construction Pro TipsFold back side flaps and keep them in place temporarily with shims, staples or house foil, not staples. Use a small piece of tape so that it does not tear the WRB when it is removed. Patch up the tears that happen with the tape of the joke seal. If there is no fastener in the way, fold the WRB back under you. 5/26 Construction Pro TipsEven with perfect installation, water can still find its way into the opening. It is a good idea to have a sill in a rough opening so that unwanted water can find a way out again. One easy way to achieve an inclination is to rip and install an oblique piece of weatherproof siding. Plan ahead and build rough openings about 1/2 more to help you keep the siding width. Shim under siding if the hatch is super off-level, but avoid lifting windows more than other windows nearby. The difference in height will be noticeable and unsightly. 6 / 26 Construction Pro Tips We install Dupont FlexWrap on this window. There are other acceptable products on the market, but FlexWrap has great results and is recommended by the people at Marvin. Poop the 6-inch, pulling off the flashing tape and positioning the bar over the threshold flush with internal framing. Run the tape at least six inches up the sides of the opening. PRO TIP: Eric pushes the tape firmly into the corners with speed or a drift square. 7/ 26 Construction Pro TipsRem's smaller backing strip and push the tape down on the wall. This flashing is pressure sensitive and should be pressed with a roller. PRO TIPS: On super cold days, the stretched corners of FlexWrap can only twist a little. Eric keeps them in place with a strip of joke seal. 8 / 26 Pro TipsSet lower shims (preferably composite) in place before setting the window. PRO TIP: Eric dabs a little seam under the shims. This helps them stay in place when installing windows, but keeps them loose enough, so they can be moved later for minor adjustments. Spacing shims near the edges, in the middle, and for larger windows one no more than 14 inches apart. 9/26 Construction Pro TipsWrap two sides of the WRB flap inside, around, and on internal framing. Paper clip or ribbon in place. 10/ 26 Construction Pro TipsRun 3/8-in. bead of sealant about half an inch in from the edge of the opening. Leave a 3/4-inch gap on each side of all four corners. Leaving the corners free of caucasus ensures that the angular seals have a clean, smooth sticking surface. No caulk under the bottom fingernails nailed. Most outdoor class window, door and siding seam will work. 11 / 26 Construction Pro TipsVest reason for plumbing windows because if the wall is outside the plumbing, so goes the window. But do the carpenters a favor and double-check that the window pins are as high as possible even with framing. If one side of the window protrudes away from the other, installing the housing can be a difficult proposition. Make only minor adjustments. Excessive twisting of windows can cause the wings to get stuck or held instead of working smoothly. 12/ 26 Construction Pro TipsHave your helper on the inner center window in the opening. Adjust the shims so that the bottom of the window is in the level and that each one is in contact with the window. Install two 2-inches. fasteners of the outer class on each side near the bottom of the window, and then again check the bottom with the level. PRO TIP: Eric prefers screws to nails because it's easier to adjust the window if something comes out of whack. GRK screws are his favorite. 13/26 Construction Pro TipsCheck that window is square by measuring diagonally in both directions. Adjust the top of the window one way or another until the measurements are the same. PRO TIP: To ensure precise measurement, always attach the tape under the vinyl drip cap. The drip cap also helps to keep its tape measure in place. Install the two fasteners at the top near the corner, then check the square again. Do not install the fasteners again until the window is clipped and sealed from the inside. 14/26 Construction Pro Tips The next few pages will walk you through the sealing process around the window. Here's what it's supposed to look like when you're all done. Note for example: Again, this is an approved method for installing Marvin windows. Methods of other manufacturers will differ. 15/ 26 Construction Pro TipsBefore installing more shims, insert a backer stick on both sides and on top, but not at the bottom. Push the rear bar firmly against the back of the nailed side. PRO TIP: Eric uses his speed/rafter square to make a few passes pushing in just a few centimeters at a time. The idea behind this backer stick is to eliminate bridging and infiltration of water. It prevents lateral sciates from fighting the adhesion attachment, which could channel heat and water. 16 / 26 Construction Pro TipsThere are three ways to make sure the jambs are flat before installing the side shims:Inspect the detects (space) between the jams and the wings. They should be even. The distance between the two side jambs should be equal at the top, middle and bottom. This can be verified by simple measurement. PRO TIP: Instead of measuring, Eric uses the top station as a pillar of the story and compares the gaps between the stop and the jamba at the top, bottom and center. Create your own story pole if the window you're installing doesn't have an upper station, and you have a bunch of them to install. Open and close both wings to make sure they work smoothly. 17/26 Construction Pro TipsInstall shims on the sides of the windows in the middle, and about 4 inches down from the top and up from the bottom. Some windows have dedicated holes for attaching jambs to framing (see next page). Place shims in these locations. Often times, the center of the side jambs will have to be pushed a little. PRO TIP: Eric pushes jambs over with an Air Shim bag to the exact spot he wants and then installs shims. Don't sew at the top of the window. If the building is placed, the window could be squeezed, likely causing the window to stop working properly and could even result in broken glass. 18/26 Construction Pro TipsU accessory to the fasteners in the nail pendant, this window is held in place with screws passing through a mount called a receiver block. It is located in the control fence and can be accessed by removing the lower front. Shims should be located in these locations. PRO TIP: The long bid holder will make it easier to avoid hitting the window with a drill. 19/26 Construction Pro TipsRun foam bead that expands low in gap along the back bar. Don't do it again. Just drop enough foam to create a 1 or 1-1/2-n. bead that bridges the entire space between windows and framing. Run bead from a little way along each side of the shim. Do not fill the entire space because even low-spreading foam can expand enough to distort the jambs. PRO TIP: Place the exercise bag on a piece of cardboard so you can adjust the gun and estimate how quickly to move the tip within a gap. 20/26 Construction Pro TipsStarting on one of the lower shims, push into a backer stick around the bottom and up to the other shim. Don't push to the end like you did with the other bar. Just push almost to the point where jam meets the window. (see Seal from within). 21 / 26 Construction Pro TipsFule distance from the lower rear rod almost all the way to the inner edge of the frame. Tool in the seamstress with a finger or a small piece of backer stick to ensure that the entire gap gets filled. This rear dam will prevent any water that passes by the other, defense against instia in the house. If the window is correctly installed, nothing should stop the water from escaping back to the large outdoor area. 22/ 26 Construction Pro TipsFill in the rest of the gap on the sides (above the lower shims) and top with fiberglass or stone wool insulation. Fill the whole void, but keep it loose and fluffy. Insulation loses its effectiveness the tighter it packs. 23 / 26 Construction Pro Tips If the window you are installing requires angular seals, now is the time to install them. 24 / 26 Construction Pro TipsSome windows have a nailed grip that is an integral part of the window (usually vinyl windows), but this window does not have. Thus, in order to seal the area where the adverb meets the window, the flickering tape must be run on the side of the window at least 1/4-inch. First install the strip on the side, about four inches past the bottom of the window and about an inch higher than the upper nailed pin. Run a flickering bar on top of at least six inches next to the window on each side. 25/26 Construction Pro TipsFold down the top flap of the WRB and cover the two angular cut with a seal tape. Do not paste the entire bottom of the flap. Instead, just use a few small straps to keep it in place. Yes, you guessed it. The gaps between the lanes are there to create an escape route for any water that deduces behind the WRB above the window opening. 26 / 26 That's all there is too! Okay, we admit that installing windows is not as simple and simple as it used to be... but neither are water damage and callbacks. We would like to thank our two experts for stopping by and walking us through the whole process:Meet the expertsLori GundersonLori's Tyvek Specialist for more than 12 years. It works closely with architects, generals, builders and installers to help build a quality, energy efficient building. Before becoming a Tyvek Specialist, she worked for a national builder for more than 10 years where she managed individual family and multi-man projects. She is very passionate about her work and is highly respected in the construction industry. Eric Klein, senior installation and services instructorEric has been employed by Marvin Windows and Doors since March 1984 and trained thousands of installers at facilities in Warroad, MN and on his travels that took him around the world. He is an accredited instructor and certifies installers in residential, light advertisement and commercial installation of windows and doors. Eric is also working with several contributors and suppliers on how to better serve installers, contractors, and services with better tips and tricks and knowhow installation.
